

Last 12 months: from Jul 2025 to Jun 2026

How to read the chart for pricing decisions:

- Mostly green/blue bars in a month → guests commit early for these dates; you have pricing power, raise the floor for the same window next year.
- Mostly red/orange bars → last-minute market; price lower up front and use small late discounts to fill, instead of holding out for advance bookings.
- Within a month, if green (early) bars are SHORTER than red (late) ones, you have accidentally rewarded early commitment — invert that gradient.
- Compare months on the shared Y axis: those consistently higher are structural peaks; those stuck low are structural troughs (trim the base price there, do not just wait).
- Isolated 1-2 night gaps between bookings are near-pure margin: a targeted 20-30% discount on just those nights typically fills them without cannibalizing adjacent stays.
